Project Design Phase
Proposed Solution Template

Date	02 October 2026
Team ID	SWTID-2026-5414
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Entering and updating employee information in ServiceNow manually is time-consuming and error-prone, and can lead to duplicate or inconsistent records. A reliable way to bulk-load employee details (Employee ID, Name, Email, Department and Location) with validation before they reach the Employee table is needed.
2.	Idea / Solution description	Employee details are maintained in a spreadsheet and imported into ServiceNow using Import Sets and Transform Maps. The uploaded data is first stored in an Import Set Table for temporary processing and validation. A Transform Map then maps these fields to the corresponding fields in the target Employee table. Employee ID is used as the unique identifier: existing employees are updated, and new employees are inserted as new records.
3.	Novelty / Uniqueness	Data is staged and validated in an Import Set Table before it touches the Employee table. Using Employee ID as the unique identifier means one import both updates existing employees and adds new ones, avoiding duplicate records. The solution relies only on built-in ServiceNow features.
4.	Social Impact / Customer Satisfaction	Employee records stay accurate and up to date, which reduces manual effort and data-entry mistakes for the teams that maintain them and improves trust in the data used across the organization.

5.	Business Model (Revenue Model)	This is an internal efficiency solution rather than a revenue product. Value comes from saved time and reduced errors in employee data management, using the existing ServiceNow platform.
6.	Scalability of the Solution	The same staging-and-transform approach handles larger spreadsheets and repeated imports, and the Import Set and Transform Map can be extended with more fields or reused for other tables.
